INTRODUCTION

In order to economize we have combined two fiscal year reports. The publication thus represents the 63rd and 64th annual report of pests and pathogens found in agricultural quarantine inspection. It is the eighth in the series to be assembled and printed from computerized interception records. It summarizes records of exotic living plant pests or pathogens of quarantine significance found in, on, or with plants, plant products, carriers, and container vans, imported or entering into the continental United States and Hawaii or the offshore possessions, or moving between these areas.

Accumulated totals for organisms are listed under headings indicating either that the intended use of the contaminated host is consumption or propagation, or that the item is not intended for importation and is designated as nonentry.

Incompletely identified organisms belonging to economic pest groups are included in the lists when they are not taxonomically separable to the degree required for a comprehensive pest risk assessment.

Honeybees of the genus *Apis* are included to reflect enforcement of the Honeybee Act of 1922, as amended 1976.

This list was compiled from interception records processed during fiscal years 1980 and 1981. Insect, pathogen, mite, and nematode identifications are made by personnel of Plant

Protection and Quarantine (PPQ), Animal and Plant Health Inspection Service (APHIS), the Insect Identification and Beneficial Insect Introduction Institute (IIBIII), Beltsville

Agricultural Research Service, Science and Education (BARC-SE), and cooperating scientists.

Scientific names of listed organisms were reviewed by scientists of PPQ and IIBIII. Scientific and common names of host plants were verified using Hortus III, Standardized Plant Names, and other botanical resources.

REVISED FORMAT FOR HOST LISTING

The fiscal year 1980 uses a revised format for recording hosts. The scientific name of the plant is followed by a qualifier in parenthesis describing the part of the plant infested, e.g., Citrus sinensis (leaf). For general cargo the commodity name is followed by a qualifier in parenthesis describing the manner of infestation, e.g., machinery (crating). Due to the transition some listings use the format of previous issues while other listings use the new format.

PEST ORIGIN

Countries of origin shown for pest interceptions are obtained from the best available source at the time of interception. They are not meant to be used for the purpose of providing distribution data for a pest. Though not meant to be definitive, every effort is made to insure the accuracy of this information.

ERRATA

In the APHIS 82-7 (February 1981) issue, Xanthomonas citri (Hasse) Dows was erroneously listed with South Africa as a country of origin. This reference is incorrect and should be deleted.
